ENERGYDRIVE SYSTEMS

Development baseline.

One starting point. Consistent standards.
Human-controlled delivery.

01

Shared environment

Containerized development.
Locked Python dependencies.

02

Shared standards

Clear structure, focused tests,
and evidence-based review.

03

Controlled delivery

Reviewable source, immutable
artifacts, and human approval.

FROM REPOSITORY TO READY

Same setup. Every project.

A repeatable environment instead of machine-specific setup.

1

Clone & open

Start from the template in VS Code.

2

Reopen in Container

Choose the container after reviewing/trusting it.

3

Sync automatically

uv creates/syncs .venv from locked dependencies.

4

Build & verify

Use the configured Python interpreter and tools.

Inside the container

Python .venv · uv.lock · Ruff · Pyright · pytest

Prerequisites

Docker running + VS Code Dev Containers.

Explicit exceptions

Designer runs on the desktop; Ignition scripts use its embedded runtime.

Opening the folder alone does not silently start containers or apps.

GUIDANCE + EVIDENCE

Agents assist. Standards lead.

Two-part review

Standards compliance and requirements coverage are assessed separately.

Bug-fix evidence

Reproduce the symptom, verify the root cause, and demonstrate the regression fix.

Material 3 by default

Shared UI tokens, adaptive layouts, accessible controls, and actual usability checks.

Documentation in every PR

Affected docs and a change record ship with the implementation.

Shared agent entry points

Claude Code

Codex

GitHub Copilot

10 focused skills

Interview & terminology
Implement & diagnose
Review & assess readiness
Ignition, database & Terraform

ONE BASELINE, DISTINCT RUNTIMES

A common foundation. The right rules for each system.

Python

Services & integrations

Typed contracts and locked dependencies

Container/venv tests and failure checks

Ignition Perspective

UI & SCADA

Native resources with Material 3 principles

Alarms, quality, and gateway acceptance

Databases

BigQuery · PostgreSQL · SQL Server

Data/time contracts and migration parity

Dialect-specific behavior and query costs

Terraform

Infrastructure as code

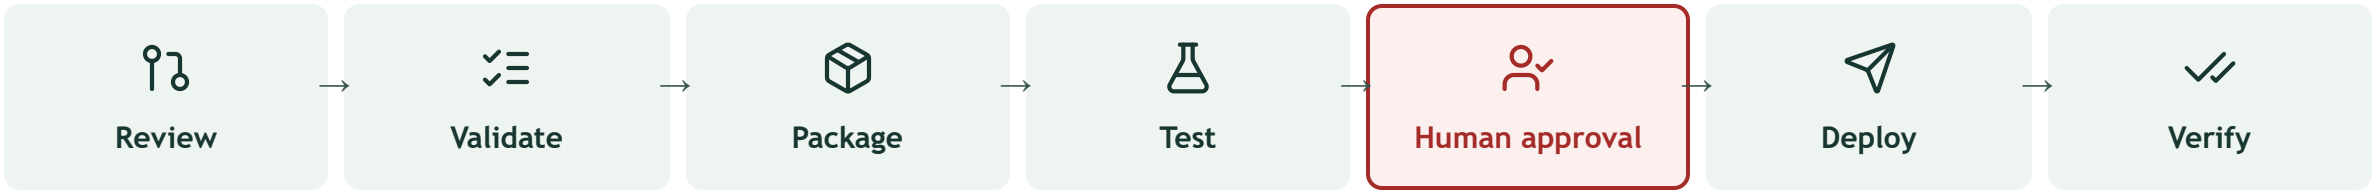

Versioned configuration and state boundaries

Drift, replacement, and ownership review

Combined or separate projects; activate only the profiles you need.

EVIDENCE BEFORE PROMOTION

Automate checks. Keep people in control.

Provided by the template

Quality/security checks, artifact packaging, promotion scaffold, and readiness guidance.

Configured by each project

Real owners, GitHub protections, deployment adapters, runtime acceptance, and recovery.

Production stays blocked until configured.

Agents have no production execution authority. Equipment-affecting changes also need operational approval.
